

# ADEX Intraday Continuous Market

Member Workshop

14 October 2026, 14:00–15:00 CEST

# Go-Live Overview

Planned Go-Live: **20 October 2026**, subject to final preparations and testing. The common ADEX M7 environment will serve Hungary, Slovenia and Serbia.

| Workshop discussion       | Questions we will address                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Connecting to ADEX        | How will Users and APIs access the common environment, and how will new M7 identifiers affect internal systems?       |
| Managing trading capacity | How does ECC establish the common trading limit, and how does it replace the existing limits across the ADEX markets? |
| Navigating Go-Live        | What happens between the market halt and reopening, how do Members confirm readiness, and where can they get support? |
| Beyond the transition     | How would a return to the previous platforms work, and which V7 and order-handling changes will follow after Go-Live? |

# Member Responsibilities and Support

Report outstanding readiness issues before 20 October and monitor official communications throughout the transition.

|                        | Required Member action                                                                                                                                                                |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Before Go-Live         | Confirm production access, API setup, User mapping and identifier readiness. Coordinate trading limits with your Clearing Member or Clearing Bank.                                    |
| On Go-Live day         | Wait for ADEX market halt/opening confirmation, then check access and trading activities. Report issues immediately.                                                                  |
| Official communication | Monitor <a href="mailto:idmarketops@adex-spot.com">idmarketops@adex-spot.com</a> for halt, migration, opening, delays and any rollback announcements. Inform relevant internal teams. |

## Support

ADEX Market Operations handles access, connectivity and operational issues. Membership, contracts and market-specific admission questions go to the relevant BSP, HUPX or SEEPEX Membership/Sales team.

# Go-Live Sequence on 20 October

All times are CET/CEST. The opening time is approximate and depends on successful migration. Only explicit ADEX confirmation authorizes trading.

| Date / time (CEST)       | Milestone                         | Member action                                                                                                                   |
|--------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| From 29 September 2026   | ADEX trading limit preparation    | ADEX_CONTINUOUS_EUR is available for preparation. Members coordinate with their Clearing Bank to configure the required limit.  |
| Before 20 October        | Production readiness              | Verify access, API configuration, identifier handling and trading limits.                                                       |
| <b>20 October, 15:30</b> | Member trading limit verification | ADEX and Members verify that the required Member trading limits are correctly available in M7 before market opening.            |
| 14:00                    | Existing markets halt             | Halt of HUPX and BSP/SEEPX continuous markets.                                                                                  |
| 14:05                    | Final trading data download       | Members download trading data from BSP/SEEPX and HUPX production environments. Final Trade IDs support the clearing transition. |
| 14:00 - 16:30            | Technical migration               | Monitor official ADEX communications. Do not submit orders.                                                                     |
| Approx. 16:30            | Planned ADEX opening              | Wait for explicit opening confirmation from ADEX.                                                                               |
| Following opening        | Trading and monitoring            | Verify access, trade confirmations and downstream processing.                                                                   |
| 20–27 October            | Rollback window                   | Retain previous access, configuration and trading limits.                                                                       |
| After 27 October         | Successful transition             | Previous ECC limit definitions decommissioned after the rollback period.                                                        |

# Production Access and User Mapping

ADEX plans to distributed individual production access information on 13 October 2026.

## User access checks

| User group      | Verification            | When           |
|-----------------|-------------------------|----------------|
| All Users       | Login and permissions   | Before Go-Live |
| HUPX Users      | Old/new User ID mapping | Before Go-Live |
| New credentials | Password instructions   | On receipt     |

HUPX Members should reconcile the User mapping with internal records and trading applications.

Complete required password changes or resets using the instructions supplied with the credentials.

## Production access package

| Item             | Member action          | When           |
|------------------|------------------------|----------------|
| Application IDs  | Configure applications | On receipt     |
| API certificates | Install and configure  | On receipt     |
| Connectivity     | Whitelist URLs / ports | Before Go-Live |

The production environment remains in Market HALT. Credentials permit preparation checks, not trading. Wait for explicit ADEX opening confirmation.

# Member/User Setup

| Topic               | What applies                                                                                                                                         |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial setup       | ADEX performs the initial setup of Members, Balancing Groups/Portfolios, Users and API connectivity from existing market configuration               |
| User assignment     | Users are assigned by market area access and may hold several Balancing Groups/Portfolios; one is configured as the default after login              |
| Multi-market access | Members active in several market areas may be contacted individually to confirm User assignments and the preferred default Balancing Group/Portfolio |
| Approval            | The Membership team of the respective market area reviews and grants access and confirms User to Balancing Group/Portfolio assignment                |

# API Access in a Multi-Power-Exchange Setup

- API access is linked to the ADEX Power Exchange (BSP, HUPX, SEEPEX), not to the individual market area.
- API access does not require a separate User – it is granted as an additional right to an existing User.
- For API access on a further ADEX Power Exchange, the request is submitted through that Power Exchange's Membership team; an additional Application ID and API certificate are then issued.
- A User with API rights may only be assigned to Balancing Groups/Portfolios of market areas for which API access has been granted.
- Valid Application IDs and certificates may be used across all market areas the Member has access to – Members may work with one shared set or with several, depending on their preferred technical setup.

# M7 Identifier Changes

M7-generated identifiers will change in the common production environment. Internal systems must not assume continuity across the migration.

## Contract IDs

New, significantly higher IDs. The same product can have different IDs across environments.

## Trade IDs

New, significantly higher numbering ranges, separate from the previous environments.

## Order IDs

New, significantly higher numbering ranges support separation of pre- and post-migration data.

## Other identifiers

List IDs and similar backend identifiers may restart from their initial values.

Review ID length and range validation, reconciliation and reporting. Do not use Contract IDs alone to identify products across environments. Resolve impacts before Go-Live.

# Single ADEX Trading Limit

ADEX\_CONTINUOUS\_EUR will apply across all ADEX markets for which a Member is admitted.

Clearing Members must review the new limit in the ECC Member Area / SMSS and adjust it before Go-Live.

| Before market cutover                                                                        | After confirmed ADEX opening                                                                                                                                                                                                                                                                                                           | In case of rollback                                                                                                            |
|----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| HUPX_CONTINUOUS_EUR and BSP_SEEPEX_CONT_EUR remain applicable until cutover.                 | ADEX_CONTINUOUS_EUR becomes applicable following the successful opening.                                                                                                                                                                                                                                                               | HUPX_CONTINUOUS_EUR and BSP_SEEPEX_CONT_EUR will be reactivated                                                                |
| Keep both previous limit definitions available throughout the 20–27 October rollback window. | If an individual ADEX_CONTINUOUS_EUR limit for a Non-Clearing Member (NCM) prior to the implementation has been set, this value remain unchanged and won't be overwritten by ECC.<br>For all other NCMs without a pre-configured limit, ECC determine the initial limit based on existing trading admissions and current limit values. | If rollback occurs, ECC reactivates the previous limits. Decommissioning follows successful completion of the rollback period. |

# ECC Initial Limit Configuration

ECC initially configured ADEX limits as an administrative service. Clearing Members remain responsible for monitoring, maintaining and ensuring adequate limits.

| Member situation             | Initial ADEX limit                                                                                                                            |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Individual ADEX limit exists | Existing individual ADEX limit retained                                                                                                       |
| HUPX admission only          | Existing HUPX limit applied                                                                                                                   |
| Direct Clearing Participants | ECC transfers base limits and distribution preferences, aggregating HUPX and BSP values where both exist. Submit form 009 to request changes. |
| Both existing environments   | Existing limits aggregated                                                                                                                    |
| BSP/SEEPEX admission only    | Existing BSP/SEEPEX limit applied                                                                                                             |

# Rollback Arrangements

Rollback window: 20–27 October 2026. Follow official ADEX and ECC communications.

## Rollback decision

ADEX may initiate rollback if significant issues cannot be resolved in an acceptable timeframe.

## Restoration

Previous HUPX and BSP/SEEPEx markets are expected to resume within one day of the decision.

## Member readiness

Retain previous production access and configuration. Keep the previous ECC limits available.

## Trading data stays in its source environment

ADEX trading data will not transfer back to the previous environments. Retain records locally and distinguish the identifier ranges used before migration, on ADEX and after any rollback.

# New Functionalities After Go-Live

Full V7 functionality and change or Order handling is planned after Go-Live.

| For initial Go-Live                                                                                       | After Go-Live                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Limited V7 functionality as available in the simulation environment                                       | Before full V7 functionality is introduced, all relevant V7 Users will be required to complete the applicable full compliance testing. |
| The initial migration will not include the planned transition from local to remote XBID Order ID handling | ADEX will communicate the detailed V7 implementation plan and the timing of further technical enhancements separately                  |

# Final Member Readiness Checklist

Complete the checks below before 20 October and report any issue that could affect readiness.

| Area                  | Required verification                                 | Timing         |
|-----------------------|-------------------------------------------------------|----------------|
| Production access     | New credentials received and access verified          | Before Go-Live |
| Network connectivity  | Production URLs and ports whitelisted                 | Before Go-Live |
| API connectivity      | Application IDs and certificates configured           | Before Go-Live |
| Users and markets     | Permissions, market areas and portfolios verified     | Before Go-Live |
| HUPX User mapping     | Existing and new User IDs reconciled                  | Before Go-Live |
| Internal systems      | New Contract, Trade and Order ID ranges assessed      | Before Go-Live |
| Clearing              | ADEX_CONTINUOUS_EUR limit reviewed                    | Before Go-Live |
| Rollback readiness    | Previous production access and configuration retained | 20–27 October  |
| Operational readiness | Internal teams briefed on the migration sequence      | Before Go-Live |

# Decomission of the former BSP/SEEPEX and HUPX M7

Seven (7) days after the successful go-live, provided that no rollback has been initiated, the former M7 access rights in BSP/SEEPEX and HUPX M7 will be revoked.

Members are requested to complete all data download-related activities by 28 October 2026. Afterwards the trading data from the current BSP/SEEPEX and HUPX M7 will not be available for Members.

# Questions and Support

Raise remaining questions now. ADEX Market Operations will coordinate any required follow-up.
